INSTALLATION ONTO GRASS

It can be easily installed onto grass substrates simply by following the recommendations set out here: trace the encumbrance of the slabs and dig the substrate up to 3 cm. Then apply a layer of gravel to ensure perfect drainage and proceed with the installation of slabs always checking the planarity of the surface.

INSTALLATION ONTO GRAVEL

It can be installed onto gravel substrates simply by placing the slabs adjacent to one another or creating pathways by installing individual slabs onto the gravel support. It is also advantageous to integrate, below the layer of superficial gravel, another layer of gravel and or pebbles in order to ensure perfect drainage. This installation solution is functional, quick and with a strong visual impact.

RAISED INSTALLATION

For raised installation, slabs are installed onto supports with a distance of 3mm between adjacent slabs once the underlying footing has been duly layered with water-proofing materials. In this way, there is a technical gap below the foot-plan that can be easily inspected by lifting the slabs.

INSTALLATION WITH ADHESIVE

Compared to standard thickness tiles slabs, installed using the traditional technique, offer a higher resistance to loads which is particularly suitable for carriageable floors.

RECOMMENDATIONS FOR INSTALLATION

DRY-SYSTEM SPACED INSTALLATION ONTO GRASS

- A LAYER OF GRAVEL OF 5 CM (GRANULOMETRY 4/8 MM)
- B SOIL

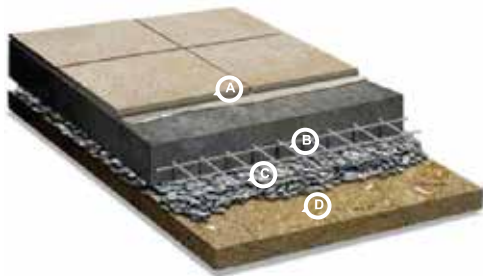

DRY INSTALLATION ONTO GRAVEL

- A LAYER OF GRAVEL OF 5 CM (GRANULOMETRY 4/8 MM)
- B DRAINING GRAVEL LAYER
- C SOIL

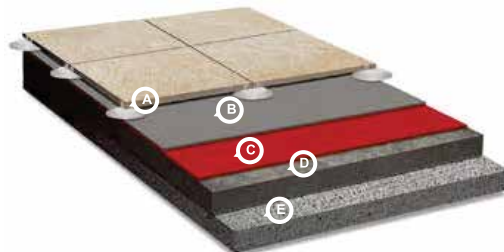

TRADITIONAL ADHESIVE INSTALLATION

- A ADHESIVE
- B FOOTING WITH ELECTRO-WELDED NET
- C DRAINING LAYER
- D SOIL

RAISED INSTALLATION ONTO SUPPORTS

- A SUPPORTS
- B DRAINAGE SHEATH
- C WATER-PROOFING SHEATH
- D INCLINED FOOTING
- E SOIL
